

# YIT: Cooperation with XMLdaton Shortened Testing Times and Decreased Costs

YIT has shortened testing times for its banking data as a result of cooperation with XMLdaton. In addition, projects have become more efficient and costs have decreased.

YIT, provider of building systems and construction services was among the first Finnish companies to start the XML migration process for SEPA in 2009. Finnish payments have already been transferred to the SEPA world. Instead of choosing a traditional and heavy-structured process, YIT chose XMLdaton, who has proved to be flexible.

- The data is processed through XMLdaton Validator service and errors are noticed immediately. The testing times shortened from a week to a couple of days, which increased the efficiency of the projects. We're saving time and money, states **Marjut Pale**, Head of Cash management from YIT.

XMLdaton and YIT have established a regular process: all outgoing payments are tested in the implementation, as well as in crucial maintenance phases before transferring it to the real world – the actual banking program.

- XMLdaton is an innovative company with a unique service. The collaboration has been beneficial to both parties. It's very important for us not to have to test our data at the real bank program. We have established a long-term relationship with XMLdaton in testing.

*Internationally operating XMLdaton® is specialized in testing all payment-related XML. It offers reliable, efficient, web-based and real-time services and products that speed up ISO 20022 XML migration projects while decreasing costs and saving time.
